Addition of a range of organocuprates to ( $S$ )- $N, N^{\prime}$-bis( $p$-methoxybenzyl)-3-methylene-6-isopropylpiperazine-2,5-dione $\mathbf{8}$ affords cis-3-isopropyl-6-alkyldiketopiperazines in excellent yield and $>95 \%$ de. Subsequent deprotection and hydrolysis of these cis-3-isopropyl-6-alkyldiketopiperazines affords homochiral ( $S$ )- $\alpha$-amino acids in excellent yield.

## Introduction

Homochiral $\alpha$-amino acids are important synthetic targets for the development of new methodologies for asymmetric synthesis. ${ }^{1}$ As a consequence, a large number of simple heterocyclic chiral auxiliaries have been developed, many of which are based on the diastereoselective alkylation of masked glycine enolate fragments. ${ }^{2}$ In order to address many of the problems associated with the scale-up of this class of auxiliary, we have recently reported on ( $S$ )- $N, N^{\prime}$-bis ( $p$-methoxybenzyl)-3-isopropylpiper-azine-2,5-dione $\mathbf{1}$ as a new chiral relay for the preparation of homochiral ( $R$ )- $\alpha$-amino acids. ${ }^{3}$ Alkylation of the enolate derived from 1 with a representative range of alkyl halides gave highly crystalline trans-alkylated products 2a-f in $>90 \%$ de, which, after simple recrystallisation of the crude reaction products, afforded pure homochiral trans-alkylated diastereoisomers 2a-f in good yield (Scheme 1). The high diastereoselectivities observed have been interpreted to result from a chiral relay mechanism involving the conformational preference of the $N-p$ methoxybenzyl protecting groups (Fig. 1). ${ }^{3,4}$ Deprotection of the trans-alkylated auxiliaries $\mathbf{2 a}$ or $\mathbf{2 b}$ to their constituent $\alpha$-amino acids was easily achieved via oxidative removal of the $p$-methoxybenzyl groups using ceric ammonium nitrate in $\mathrm{CH}_{3} \mathrm{CN}-\mathrm{H}_{2} \mathrm{O}$, to afford 3a or 3b in good yield. Subsequent acid catalysed hydrolysis of these trans-diketopiperazines gave a mixture of the $(R)$-amino acids $\mathbf{4 a}$ or $\mathbf{4 b}$ and $(S)$-valine $\mathbf{5}$ which were separated by ion exchange chromatography to afford homochiral $(R)$-phenylalanine $\mathbf{4 a}$ and $(R)$-alanine $\mathbf{4 b}$ respectively, in good yield (Scheme 1). ${ }^{3 a, b}$

Electrophile attacks anti to both the C3 isopropyl and N1 protecting group.

Fig. 1
While this methodology is ideally suited to the preparation of homochiral $\alpha$-amino acids of known absolute configuration, situations often arise where both enantiomers of a target $\alpha$ amino acid are required. ${ }^{5}$ Although both enantiomers of the target $\alpha$-amino acid may be prepared separately via duplicate syntheses employing the same chiral auxiliary of opposite absolute configuration, this approach is tedious and inherently wasteful. An attractive alternative to this parallel synthesis approach would involve the preparation of both enantiomers of an $\alpha$-amino acid from the same homochiral auxiliary via a

a) benzyl, b) methyl, c) ally|, d) propargyl, e) ethyl, f) isopropyl

Scheme 1 Reagents and conditions: (i) LiHMDS, THF, $-78^{\circ} \mathrm{C}$; RX; (ii) $\mathrm{CAN}, \mathrm{H}_{2} \mathrm{O}-\mathrm{CH}_{3} \mathrm{CN}$; (iii) $6 \mathrm{M} \mathrm{HCl}, \Delta$.
stereodivergent approach. In this case the stereoselective synthesis of the cis-3-isopropyl-6-alkyl derivatives $\mathbf{6}$ from $\mathbf{1}$ would enable a complementary route to homochiral ( $S$ )- $\alpha$-amino acids 7 to be achieved. For example, we have recently communicated that cis-alkyldiketopiperazine 6a may be obtained from 1 via an approach involving regioselective deprotonationreprotonation of trans-( $3 S, 6 R$ )-3-isopropyl-6-benzyldiketopiperazine derivative 2a. Thus, treatment of 2a with $n-\mathrm{BuLi}$ in THF at $-78{ }^{\circ} \mathrm{C}$ resulted in regioselective deprotonation at C6, affording an enolate which was stereoselectively reprotonated at C6 from the Re-face to afford cis-( $3 S, 6 S$ )-3-isopropyl-6-benzyldiketopiperazine 6a ( $92 \%$ de, $93 \%$ yield). Chromatographic purification of the reaction mixture afforded diastereoisomerically pure and homochiral $\mathbf{6 a}$ with no evidence of any racemisation at the C3 stereogenic centre, enabling deprotection of $\mathbf{6 a}$ to afford homochiral ( $S$ )-phenylalanine 7a in excellent yield (Scheme 2). ${ }^{6}$
In order to widen the range of substrates to which this stereodivergent approach may be applied we now report herein that a wide range of cis-3-isopropyl-6-alkyldiketopiperazines $\mathbf{6}$ may be prepared in excellent de, via a versatile synthetic approach involving 1,4-conjugate addition of organocuprates to the 6 -methylene acceptor 8 . Part of this work has been previously communicated. ${ }^{7}$

## Results and discussion

Conjugate addition of organocuprates to ( $S$ )-3-methylene-6isopropyldiketopiperazine acceptor 8

There have been many reports detailing the use of chiral auxiliaries to control the asymmetric 1,4-conjugate addition of nucleophiles to $\alpha, \beta$-unsaturated acid fragments, ${ }^{8}$ however the use of this of strategy for the asymmetric synthesis of homochiral $\alpha$-amino acids is less well investigated. Strategies involving the conjugate addition of chiral nucleophiles to $\alpha, \beta$ unsaturated acceptors, or the addition of nucleophiles to chiral $\alpha, \beta$-unsaturated acceptors have been reported, however these methodologies suffer from practical problems that affect either the yield or ee of the target $\alpha$-amino acid. ${ }^{9}$ In order to address the synthetic problems associated with this conjugate addition methodology, we proposed that addition of organocuprates to ( $6 S$ )- $N, N^{\prime}$-bis ( $p$-methoxybenzyl)-3-methylene-6-
isopropylpiperazine-2,5-dione 8 (derived from methylenation of $\mathbf{1}$ ), would afford an enolate fragment 9 which would be diastereoselectively reprotonated to afford cis-3-isopropyl-6-alkyldiketopiperazines 6 in excellent de. Subsequent deprotection and hydrolysis of cis-6, according to our previously published procedure, would afford the desired (S)- $\alpha$-amino acids 7. The dehydroalanine derived acceptor $\mathbf{8}$ was easily prepared in $92 \%$ yield via deprotonation of 1 with $n$-BuLi in THF at $-78^{\circ} \mathrm{C}$, quenching the resulting enolate with paraformaldehyde, and heating the crude reaction mixture for 1 hour prior to workup. The stereochemical integrity of the C3 stereocentre of $\mathbf{8}$ was confirmed to be $>95 \%$ ee by comparison of the $500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectrum of homochiral 8 with that of an authentic

Table 1 Yields for organocuprate additions to methylene acceptor $\mathbf{8}$ to afford 6a-f

| Product | R | Cuprate conditions | Isolated yield (\%) |
| :---: | :---: | :---: | :---: |
| 6 a | Ph | $2 \mathrm{PhLi-CuCN}$ | 88 |

sample of $( \pm) \mathbf{8}$ (prepared de novo from racemic valine) in the presence of the chiral solvating agent 2,2,2-trifluoro-1-(9anthryl)ethanol.
Addition of $\mathrm{Ph}_{2} \mathrm{CuCNLi}_{2}$ to methylene acceptor 8, in THF at $-78{ }^{\circ} \mathrm{C}$, followed by quenching of the resulting enolate $9 \mathbf{a}$ with aqueous ammonium chloride, afforded a crude reaction mixture which contained the cis-( $3 S, 6 S$ )-3-isopropyl-6-benzyldiketopiperazine $6 \mathbf{a}$ as the only identifiable product. The diastereoselectivity of this reaction was confirmed as $>95 \%$ by examination of the ${ }^{1} \mathrm{H}$ NMR spectra of the crude reaction mixture which revealed the absence of any resonances corresponding to the known ${ }^{3 b}$ minor diastereoisomer trans-( $3 S, 6 R$ )-3-isopropyl-6-benzyldiketopiperazine 2a (Scheme 3, Table 1). Purification of the crude reaction mixture via chromatography afforded the desired homochiral diastereoisomerically pure cis-( $3 S, 6 S$ )-3-isopropyl-6-benzyldiketopiperazine $\mathbf{6 a}$ as a viscous oil in $88 \%$ yield. Following this general conjugate addition protocol five further cis-3-isopropyl-6-alkyldiketopiperazine derivatives $\mathbf{6 b}-\mathbf{f}$ were prepared via addition of the corresponding organocuprate to the methylene acceptor $\mathbf{8}$ in $>95 \%$ de and in $88-92 \%$ isolated yield (Scheme 3, Table 1).
The excellent cis diastereoselectivity observed in these additions arises from highly selective $R e$-face protonation of enolate 9 resulting from the conjugate addition. We have proposed that the high degree of facial selectivity in alkylation of the unsubstituted parent auxiliary $\mathbf{1}$ is the result of a chiral relay involving the $p$-methoxybenzyl protecting groups operating within the system and the selectivity in the protonation of the metallated enolate 9 a-f presumably derives from similar factors (Fig. 2). ${ }^{3,4}$ Notably the de obtained via reprotonation of the copper enolate 9 a with aqueous ammonium chloride is superior to that obtained via direct deprotonation of trans-2a and reprotonation of the lithium enolate ( $92 \%$ de) utilising the hindered proton source, 2,6-di-tert-butylphenol. ${ }^{6}$ Indeed reprotonation of the lithium enolate derived from 2a with ammonium chloride gives $\mathbf{6 a}$ in $91 \%$ de while reprotonation of the copper enolates $9 \mathbf{a}-\mathbf{f}$ with the same proton source leads to uniformly high diastereoselectivities.

## Deprotection and hydrolysis of cis-3-isopropyl-6-alkyldiketopiperazines 6 a- $\mathbf{f}$ to afford homochiral $\boldsymbol{\alpha}$-amino acids 7a-f

Deprotection of homochiral $N, N^{\prime}$-bis( $p$-methoxybenzyl)-3-isopropyl-6-alkyldiketopiperazines 6a-f was achieved in good yield via a three step process. Oxidative removal of the

Scheme 2 Reagents and conditions: (i) LiHMDS; BnBr; (ii) $n$ - $\mathrm{BuLi},-7{ }^{\circ} \mathrm{C}$; 2,6 -di-tert-butylphenol; (iii) $\mathrm{CAN}, \mathrm{CH}_{3} \mathrm{CN}-\mathrm{H}_{2} \mathrm{O}$; (iv) $6 \mathrm{M} \mathrm{HCl}, \Delta$.

9a-f
Fig. 2 Reprotonation of enolate $\mathbf{9 a - f}$.
p-methoxybenzyl groups with ceric ammonium nitrate in $\mathrm{CH}_{3} \mathrm{CN}-\mathrm{H}_{2} \mathrm{O}$ (3:1) followed by chromatographic purification over alumina to remove cerium salts afforded homochiral cis-3-isopropyl-6-alkyldiketopiperazines 10a-f in good yield. Hydrolysis of $\mathbf{1 0 a}-\mathbf{f}$, by refluxing in 6 M HCl , afforded a mixture of $(S)$-valine 5 and the desired ( $S$ )- $\alpha$-amino acids $7 \mathbf{a}-\mathbf{f}$. Whilst these $\alpha$-amino acids $7 \mathbf{a}-\mathbf{f}$ could be separated from the valine chiral auxiliary via ion exchange chemistry over Dowex 50-XH, this approach proved tedious especially when carried out on a large scale. As a result, an alternative separation approach was adopted whereby treatment of the mixture of $\alpha$-amino acids 5 and $7 \mathbf{7 a}-\mathbf{f}$ with $\mathrm{HCl}-\mathrm{MeOH}$ afforded a mixture of $(S)$-valine methyl ester 11 and $(S)$ - $\alpha$-aminoesters $\mathbf{1 2 a} \mathbf{a}-\mathbf{f} .{ }^{10}$ The free aminoesters $(S)$-12a,b,d,e were easily separated from $\mathbf{1 1}$ by fractional distillation under vacuum, whilst the more volatile esters $(S)$ 12c and ( $S$ )-12f were separated from $(S)$-valine methyl ester 11 via silica chromatography. Subsequent hydrolysis of $(S) \mathbf{- 1 2 a - f}$ to their corresponding homochiral $\alpha$-amino acids $(S)$ - $\mathbf{7 a}-\mathbf{f}$ was achieved by treatment with refluxing 6 M HCl . The enantiomeric excess of each $\alpha$-amino acid ( $S$ )-7a-f was confirmed to be $>99 \%$ ee by comparison with authentic racemic samples using chiral HPLC analysis (Scheme 4, Table 2).

## Conclusion

In conclusion, we have shown that conjugate addition of organocuprates to $N, N^{\prime}$-bis ( $p$-methoxybenzyl)-3-methylene-6isopropyldiketopiperazine $\mathbf{8}$ provides simple access to cis( $3 S, 6 S$ )-diketopiperazines $\mathbf{6}$ which may be deprotected to afford homochiral ( $S$ )- $\alpha$-amino acids 7 in good yield. Importantly this methodology is more efficient than the previously described approach based on alkylation of the enolate of $\mathbf{1}$ and provides access to $\alpha$-amino acids, such as $\mathbf{7 b}$, previously unavailable from our methodology.

## Experimental

## General

Melting points (mp) were obtained using a Thermogalen ${ }^{\text {TM }}$ III or Griffin Gallenkamp melting point apparatus and are uncorrected. Optical rotations were measured with a Perkin-Elmer 241 polarimeter with a thermally jacketed 10 cm cell at approximately $20^{\circ} \mathrm{C}$ and are reported in units of $10^{-1} \mathrm{deg} \mathrm{cm}^{2}$ $\mathrm{g}^{-1}$. Concentrations (c) are given in g per 100 ml . Infrared (IR) spectra were recorded as KBr discs on a Perkin-Elmer 1750 Fourier Transform spectrometer. Absorptions are reported in wavenumbers $\left(\mathrm{cm}^{-1}\right)$. Proton magnetic resonance spectra $\left({ }^{1} \mathrm{H}\right.$ NMR) were recorded at 200 MHz on a Varian Gemini 200 or a Bruker AC200 spectrometer, at 300 MHz on a Bruker WH300, at 400 MHz on a Bruker AC400 and at 500 MHz on a Bruker AM500 spectrometer and are referenced to the residual solvent peak. The following abbreviations were used: s, singlet; $d$, doublet; t , triplet; q, quartet; m , multiplet and br, broad. Coupling constants $(J)$ were recorded in hertz to the nearest 0.05 Hz . Carbon magnetic resonance spectra ( ${ }^{13} \mathrm{C}$ NMR) were recorded at 50.3 MHz on a Varian Gemini 200 or Bruker AC200 spectrometer, at 100.6 MHz on a Bruker AC400 spectrometer and at 125.7 MHz on a Bruker AMX500 spectrometer using DEPT editing. Diastereomeric excesses were determined by peak integration of the ${ }^{1} \mathrm{H}$ NMR spectra of the crude reaction product. Low resolution mass spectra $(m / z)$ were recorded on

a VG Micromass ZAB 1F, a VG Masslab 20-250, a GCMS Trio 1, a VG BIO Q or a APCI Platform spectrometer, with only molecular ions $\left(\mathrm{M}^{+}\right)$, fragments from molecular ions and major peaks being reported. Microanalyses were performed by Mrs V. Lamburn or Mr R. Prior, Dyson Perrins Laboratory, University of Oxford. Column chromatography was performed on silica gel (Kieselgel 60). Anhydrous THF was obtained by distillation from sodium-benzophenone ketyl under nitrogen. Unless otherwise stated all reactions were performed and worked-up under a nitrogen atmosphere. ( $S$ )-Isopropyl-piperazine-2,5-dione was prepared according to the literature procedure. ${ }^{3 b}$

## (3S)-N, $N^{\prime}$-Bis(4-methoxybenzyl)-3-methylene-6-isopropyl-piperazine-2,5-dione 8

To a stirred solution of $\mathbf{1}(5.0 \mathrm{~g}, 12.6 \mathrm{mmol})$ in anhydrous THF $(20 \mathrm{ml})$ at $-78{ }^{\circ} \mathrm{C}$ was added a solution of $n$-butyllithium in hexanes ( $8.25 \mathrm{ml}, 1.53 \mathrm{M}, 12.6 \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$, over a period of two minutes. The resultant solution was allowed to stir at $-78^{\circ} \mathrm{C}$ for a further 15 minutes prior to the addition of solid paraformaldehyde ( $c a .10 \mathrm{~g}$ ) and subsequent removal of the cooling bath. The resultant suspension was then heated at $70^{\circ} \mathrm{C}$ for one hour, cooled, water ( 3 ml ) added and the mixture was partitioned between ether and water, extracted with ether and the organic phase dried $\left(\mathrm{MgSO}_{4}\right)$; the solvents were removed in vacuo. Filtration through a short stub of silica using ether as the eluent and removal of the solvents in vacuo afforded the title compound $\mathbf{8}$ as a thick, pale yellow coloured gum that was used without further purification $(4.72 \mathrm{~g}, 91 \%) . \mathrm{Mp} 88-90^{\circ} \mathrm{C} ;[a]_{\mathrm{D}}^{23}$ -129.4 (c 2.30, $\mathrm{CHCl}_{3}$ ); $v_{\text {max }}(\mathrm{KBr}) / \mathrm{cm}^{-1} 2993,2962,2930$, 2835, 1677 ( $\mathrm{s}, \mathrm{C}=\mathrm{O}$ ), 1617 (s, C=O), 1514, 1253; $\delta_{\mathrm{H}}(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 0.90\left(3 \mathrm{H}, \mathrm{d}, J 6.8, \mathrm{CH}_{3} \mathrm{CHCH}_{3}\right), 1.04(3 \mathrm{H}, \mathrm{d}, J 6.8$, $\left.\mathrm{CH}_{3} \mathrm{CHCH}_{3}\right), 2.24\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3} \mathrm{CHCH}_{3}\right), 3.78\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.89(1 \mathrm{H}, \mathrm{d}, J 7.5,3-H), 3.93(1 \mathrm{H}, \mathrm{d}, J 14.7$, $\left.\operatorname{ArCH})_{2}\right), 4.58\left(1 \mathrm{H}, \mathrm{d}, J 14.8, \mathrm{ArCH}_{2}\right), 5.02(1 \mathrm{H}, \mathrm{d}, J 1.1$, $\left.6-\mathrm{C}=\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 5.13\left(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{ArCH}_{2}\right), 5.40(1 \mathrm{H}, \mathrm{d}, J 14.8$, $\left.\operatorname{ArCH})_{2}\right), 5.81\left(1 \mathrm{H}, \mathrm{d}, J 1.1,6-\mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 6.80-6.89(4 \mathrm{H}, \mathrm{m}$, aromatic $\mathrm{C} H), 7.15-7.20(4 \mathrm{H}, \mathrm{m}$, aromatic $\mathrm{C} H) ; \delta_{\mathrm{C}}(125 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 17.4,19.4,32.7,46.9,48.0,55.2(\times 2), 64.4,104.3,114.2$, $114.3,127.5,128.5,129.6,137.4,158.9,159.3,159.5(\mathrm{C}=\mathrm{O})$, 164.3 (C=O); m/z (CI) $409\left(\mathrm{MH}^{+}, 40 \%\right)$ (Found: $\mathrm{MH}^{+}$, 409.2127. $\mathrm{C}_{24} \mathrm{H}_{29} \mathrm{~N}_{2} \mathrm{O}_{4}^{+}$requires 409.2127).

## General procedure I: conjugate additions

To a flame dried Schlenk tube charged with anhydrous copper(I) cyanide ( $267 \mathrm{mg}, 2.94 \mathrm{mmol}$ ) and anhydrous THF ( 20 ml ) at $-78{ }^{\circ} \mathrm{C}$ under a nitrogen atmosphere was added the alkyllithium or Grignard reagent ( 5.88 mmol ). The suspension was allowed to stir at $-78^{\circ} \mathrm{C}$ for 5 min prior to the removal of the cooling bath. The mixture was allowed to slowly warm to ca. $-20^{\circ} \mathrm{C}$ by which time it had become homogeneous. This mixture was then recooled to $-78{ }^{\circ} \mathrm{C}$ and $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}(0.24 \mathrm{ml}$, 2.45 mmol ) added and the reaction stirred for 10 minutes at $-78{ }^{\circ} \mathrm{C}$. Then $8(1.00 \mathrm{~g}, 2.45 \mathrm{mmol})$ was added, the reaction stirred for 2 h at $-78{ }^{\circ} \mathrm{C}$ and then allowed to warm to room temperature over $4-5 \mathrm{~h}$. The reaction mixture was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(c a .15 \mathrm{ml})$, extracted with ether $(5 \mathrm{ml})$, then ethyl acetate $(2 \times 5 \mathrm{ml})$ and the combined organic
phases were washed with water ( 5 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvents removed in vacuo. ${ }^{1} \mathrm{H}$ NMR analysis of the crude reaction products confirmed the de to be $>95 \%$ in all cases.
(3S,6S)-N, $N^{\prime}$-Bis(4-methoxybenzyl)-3-isopropyl-6-benzyl-
piperazine-2,5-dione $\mathbf{6 a}$. Treatment of $\mathbf{8}$ according to general procedure I using phenyllithium ( $3.27 \mathrm{ml}, 1.8 \mathrm{M}$ in cyclo-hexane-ether) gave a crude reaction mixture which was chromatographed on silica gel using ethyl acetate-hexane $(1: 5)$ to afford the title compound $\mathbf{6 a}$ as a pale yellow oil $(1.05 \mathrm{~g}, 88 \%)$. $[a]_{\mathrm{D}}^{23}-234\left(c 1.00, \mathrm{CHCl}_{3}\right) ; v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 2962,1666(\mathrm{~s}, \mathrm{C}=\mathrm{O})$, $1612,1513,1456,1248 ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 0.99(3 \mathrm{H}, \mathrm{d}, J 6.8$, $\left.\mathrm{CH}_{3} \mathrm{CHCH}_{3}\right), 1.05\left(3 \mathrm{H}, \mathrm{d}, J 6.8, \mathrm{CH}_{3} \mathrm{CHCH}_{3}\right), 1.86(1 \mathrm{H}$, dsept, $J 7.9,6.8, \mathrm{CH}_{3} \mathrm{CHCH}_{3}$ ), $2.99\left(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}\right)$, $2.99\left(1 \mathrm{H}, \mathrm{dd}, J 14.0,8.4, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}\right), 3.34(1 \mathrm{H}$, dd, $J 14.0,4.3$, $\left.\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}\right), 3.53(1 \mathrm{H}, \mathrm{d}, J 7.9,3-H), 3.69\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.71$ $\left.(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH})_{3}\right), 3.71\left(1 \mathrm{H}, \mathrm{d}, J 14.9, \mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}\right), 4.06(1 \mathrm{H}$, dd, $J$ 8.4, 4.3, 6-H), $5.09\left(1 \mathrm{H}, \mathrm{d}, J 14.7, \mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}\right), 5.32$ $\left(1 \mathrm{H}, \mathrm{d}, J 14.8, \mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}\right), 6.61-6.70(4 \mathrm{H}, \mathrm{m}$, aromatic $\mathrm{C} H)$, 6.70-6.75 ( $2 \mathrm{H}, \mathrm{m}$, aromatic $\mathrm{C} H$ ), 6.93-6.97 ( $2 \mathrm{H}, \mathrm{m}$, aromatic CH ), $7.15-7.18(2 \mathrm{H}, \mathrm{m}$, aromatic CH$), 7.20-7.30(3 \mathrm{H}$, m , aromatic $\mathrm{C} H) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 19.8,20.9,33.7,40.6$, 47.0, 49.3, 55.3 ( $\times 2$ ), 61.0, 65.3, 114.1, 114.3, 127.4, 127.78, $127.82,129.0,129.1,129.4,129.5,129.7,137.6,159.2,159.3$, 166.2 (C=O), 167.2 (C=O); $m / z$ (CI) 487 ( $\mathrm{MH}^{+}, 100 \%$ ) (Found: $\mathrm{MH}^{+}, 487.2603 . \mathrm{C}_{30} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}_{4}{ }^{+}$requires 487.2596).
( $3 S, 6 S$ )- $N, N^{\prime}$-Bis(4-methoxybenzyl)-3-isopropyl-6-neopentyl-piperazine-2,5-dione $\mathbf{6 b}$. Treatment of $\mathbf{8}$ according to general procedure I using tert-butylmagnesiumchloride ( $2.94 \mathrm{ml}, 2 \mathrm{M}$ in ether) gave a crude reaction mixture from which the title compound $\mathbf{6 b}$ was crystallised directly (ethyl acetate-hexane) ( 1.03 g , $90 \%$ ). ## General procedure III: isolation of amino acid hydrochloride salts

A solution of 10a-f (200-500 mg) was refluxed in 6 M HCl ( 60 ml ) overnight and the solvent was removed in vacuo. The resultant mixture of amino acid hydrochloric acid salts was refluxed in methanolic HCl for 2 hours. The solvents were removed to afford a residue which was neutralised with $\mathrm{NaHCO}_{3}(\mathrm{aq})$, extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 30 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvents again removed in vacuo (Warning: amino acid methyl esters volatile) to give a mixture of ( $S$ ) valine methyl ester and the appropriate amino acid methyl ester 12a-f. The ( $S$ )- $\alpha$-amino esters 12a, 12b, 12d, and 12e were purified by fractional distillation/removal of the more volatile $(S)$-valine methyl ester under high vacuum at $c a .40{ }^{\circ} \mathrm{C}$ for 30 minutes. The volatile and ( $S$ )- $\alpha$-amino acid methyl esters 12c and $\mathbf{1 2 f}$ were purified by chromatography on silica using ethyl acetate-hexanes ( $3: 7$ ) as eluent and the solvent carefully removed in vacuo. The resultant amino esters were then heated in 6 M HCl under reflux for 30 minutes, and the solvents evaporated in vacuo to yield the parent $\alpha$-amino acids as their HCl salts.

The enantiomeric excess of the $(S)$ - $\alpha$-amino acids was determined by chiral HPLC analysis by either method A or method B.

Method A. Benzyl chloroformate ( 0.15 ml ) and triethylamine $(0.15 \mathrm{ml})$ were added to the amino acid hydrochloride ( 50 mg ) in dioxane $(1 \mathrm{ml})$ and the mixture was stirred at room temperature for 1 hour. This crude mixture was analysed by HPLC using a Cyclobond ${ }^{\text {TM }}$ I 2000 RSP ( $\beta$-cyclodextrin hydroxypropyl capped bonded stationary phase) column eluting with [6-15: 94-85 $\mathrm{CH}_{3} \mathrm{CN}-$ TEAA ( $1-1.5 \%$ )] with UV detection at 210 nm . The ee was determined by integration of signals and comparison of the retention times of the synthetic material and commercially available or similarly prepared racemic Cbz- $\alpha$-amino acids.

Method B. The amino acid hydrochloride was analysed by HPLC using a Chirobiotic I column eluting with 33-50\% water-ethanol with UV detection at 190 nm . The ee was deter-
mined by integration of signals and comparison of the retention times of synthetic and commercially available racemic amino acid hydrochlorides.
(S)-Phenylalanine hydrochloride 7a. Treatment of 10a $(200 \mathrm{mg})$ by general procedure III gave $7 \mathrm{a}(147 \mathrm{mg}, 90 \%) . \delta_{\mathrm{H}}$ ( $200 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ) $3.15\left(1 \mathrm{H}, \mathrm{dd}, J 14.5,7.7, \mathrm{CH}_{2}\right), 3.28(1 \mathrm{H}$, dd, $\left.J 14.7,5.9, \mathrm{CH}_{2}\right), 4.29(1 \mathrm{H}, \mathrm{dd}, J 7.2,5.9, \mathrm{NCH}), 7.21-7.38$ ( 5 H , m , aromatic $\mathrm{C} H)$; ee > 99\% method B; $[a]_{\mathrm{D}}^{23}-8.2$ (c 1.00, $\mathrm{H}_{2} \mathrm{O}$ ).
( $S$ )-2-Amino-4,4-dimethylpentanoic acid hydrochloride 7b. Treatment of $\mathbf{1 0 b}(500 \mathrm{mg})$ by general procedure III gave 7b $(354 \mathrm{mg}, 89 \%) . \delta_{\mathrm{H}}\left(200 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) 0.72\left(9 \mathrm{H}, \mathrm{s}, \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right), 1.40$ ( 1 H, dd, $J 14.8,7.4, \mathrm{CH}_{2}$ ), $1.68\left(1 \mathrm{H}\right.$, br dd, $J 14.9,4.8, \mathrm{CH}_{2}$ ), $3.47-3.52(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH})$; ee $>99 \%$ method $\mathrm{A} ;[a]_{\mathrm{D}}^{23}+4.7$ (c $\left.1.00, \mathrm{H}_{2} \mathrm{O}\right)\left[\right.$ lit. ${ }^{12}+4.2\left(c 8.5\right.$ in $\left.\left.\mathrm{H}_{2} \mathrm{O}\right)\right]$.
( $S$ )-2-Aminobutyric acid hydrochloride 7c. Treatment of 10 c $(200 \mathrm{mg})$ by general procedure III gave $7 \mathrm{c}(132 \mathrm{mg}, 88 \%) . \delta_{\mathrm{H}}$ ( $200 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ) $0.86\left(3 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{CH}_{3}\right), 1.75-1.93(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{C} H_{2}\right), 3.86(1 \mathrm{H}, \mathrm{t}, J 6.3, \mathrm{NCH})$; ee $>99 \%$ method A; $[a]_{\mathrm{D}}^{23}+12.9$ (c $\left.1.00, \mathrm{H}_{2} \mathrm{O}\right)\left[\right.$ lit. ${ }^{11}+10.1\left(c 1.11\right.$ in $\left.\left.\mathrm{H}_{2} \mathrm{O}\right)\right]$.
(S)-2-Aminoheptanoic acid hydrochloride 7d. Treatment of 10d $(200 \mathrm{mg})$ by general procedure III gave $7 \mathbf{d}(130 \mathrm{mg}, 88 \%)$. $\delta_{\mathrm{H}}\left(200 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) 0.92-1.44\left(15 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3}\right.$ and $\left.\left(\mathrm{CH}_{2}\right)_{3}\right)$, $3.46-3.54(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH})$; ee $>99 \%$ method $\mathrm{B} ;[a]_{\mathrm{D}}^{23}+4.9(c 0.20$, $\left.\mathrm{H}_{2} \mathrm{O}\right)\left[\right.$ lit. ${ }^{11}+4.4\left(c 0.2\right.$ in $\left.\left.\mathrm{H}_{2} \mathrm{O}\right)\right]$.
( $S$ )-2-Amino-3-cyclohexylpropanoic acid hydrochloride 7e. Treatment of 10e ( 200 mg ) by general procedure III gave 7e ( $151 \mathrm{mg}, 92 \%$ ). $\delta_{\mathrm{H}}\left(200 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}\right) 0.66-0.86\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right)$, 0.90-1.17 (3H, m, CH2 $), 1.20-1.23\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.37-1.59$ $\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.63-1.66\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.84(1 \mathrm{H}, \mathrm{dd}, J 8.6,5.4$, NCH); ee $>99 \%$ method $\mathrm{A} ;[a]_{\mathrm{D}}^{23}+3.1\left(\right.$ c $\left.1.00, \mathrm{H}_{2} \mathrm{O}\right)\left[\right.$ lit. ${ }^{12}+3.4$ ( $c 0.5$ in $\mathrm{H}_{2} \mathrm{O}$ )].
( $\boldsymbol{S}$ )-Leucine hydrochloride 7f. Treatment of $\mathbf{1 0 f}(200 \mathrm{mg}$ ) by general procedure III gave $7 \mathrm{f}(157 \mathrm{mg}, 91 \%)$. $\delta_{\mathrm{H}}(200 \mathrm{MHz}$, $\left.\mathrm{D}_{2} \mathrm{O}\right) 0.89\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{CH}_{3} \mathrm{CHCH}_{3}\right), 0.93(3 \mathrm{H}, \mathrm{d}, J 7.0$, $\mathrm{CH}_{3} \mathrm{CHCH}_{3}$ ), $1.54-1.75\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}\right), 3.86-3.89(1 \mathrm{H}, \mathrm{m}$, $\mathrm{NCH})$; ee $>99 \%$ method $\mathrm{B} ;[a]_{\mathrm{D}}^{23}+3.0\left(c 1.00, \mathrm{H}_{2} \mathrm{O}\right)\left[\right.$ lit. ${ }^{12}+2.8$ ( $c 0.6$ in $\mathrm{H}_{2} \mathrm{O}$ )].

## Acknowledgements

We would like to thank the EPSRC for a ROPA award (ACG and MDO'S), Oxford Asymmetry International (SDB) for their financial support, and Simon W. Epstein for assistance in the ee determinations.
